### 3D Graphics

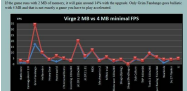

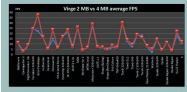

The primary feature of the 3D graphics is the ability to render 3D objects in a virtual environment. This is achieved through a combination of hardware and software. The hardware includes a GPU (Graphics Processing Unit) and a display device. The software includes a 3D engine and a game engine. The GPU is responsible for rendering the 3D objects, while the game engine is responsible for managing the game's logic and physics.

The graphics card is a key component of a computer system, responsible for rendering 3D graphics. It consists of a GPU (Graphics Processing Unit) and a display controller. The GPU is responsible for processing the 3D data and rendering it into a 2D image that can be displayed on a monitor. The display controller is responsible for sending the rendered image to the monitor. The graphics card is typically installed in a PCI Express slot on the motherboard.

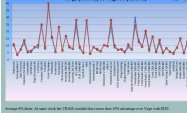

The screenshot shows a 3D rendered scene from a game. The scene is a dark, atmospheric environment with a character in the foreground. The text '1024x768' is displayed on the screen, indicating the resolution of the rendered image. The scene is rendered in a high-quality, realistic style.

The graph shows the performance of the Vega 2 60 GPU compared to the Vega 400 GPU. The y-axis represents FPS (Frames Per Second) and the x-axis represents time. The Vega 2 60 GPU shows a significantly lower and more volatile performance compared to the Vega 400 GPU, which maintains a higher and more stable FPS throughout the test.

The photograph shows a different model of a computer graphics card. It features a similar design to the first card, with a prominent GPU chip and various connectors. The card is shown from a slightly different angle, highlighting its physical dimensions and cooling solution.

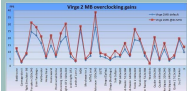

The screenshot shows a 3D rendered scene from a game, similar to the one shown in the second image. The scene is a dark, atmospheric environment with a character in the foreground. The text '1024x768' is displayed on the screen, indicating the resolution of the rendered image. The scene is rendered in a high-quality, realistic style.

The photograph shows a computer graphics card, similar to the ones shown in the previous images. It features a prominent GPU chip and various connectors. The card is shown from a slightly different angle, highlighting its physical dimensions and cooling solution.

The image shows a game controller or joystick, which is a common input device for playing video games. It is shown from a top-down perspective, highlighting its buttons and joysticks.

The graph shows the performance of the Vega 2 60 GPU with overlocking. The y-axis represents FPS (Frames Per Second) and the x-axis represents time. The overlocking results in a significant increase in FPS compared to the stock performance, with the GPU now capable of maintaining a higher and more stable FPS throughout the test.
